

Pardus 21.0 Alpha 1 Feedbacks

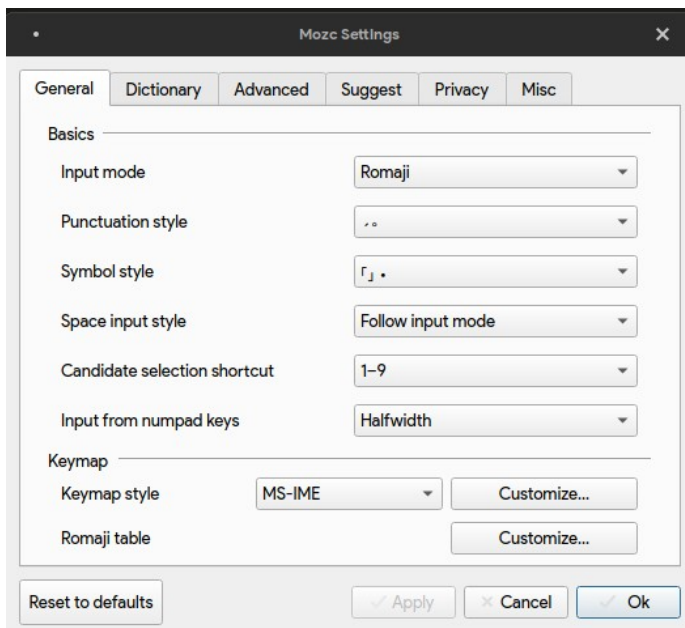

- Issue: Sources for booting OS on 32-bit EFI are missing.
Result: System doesn't boot on Atom BayTrail, CherryTrail and Intel Apollo Lake devices.
Solution: Adding grub-efi-ia32-bin package as preinstalled resolves this issue.

- Issue: GRUB bootloader theme uses low resolution in landscape orientation without obeying BIOS resolution.
Result: Theme gets a really ugly appearance on tablets like Hometech Wi101.

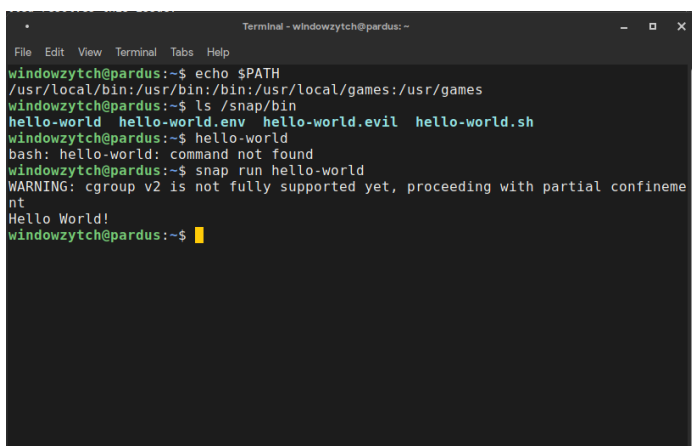

- Issue: Plymouth screen was designed to support only landscape resolutions.
Result: Screen appears cut in half on tablets having their BIOS as portrait orientation like Hometech Wi101.

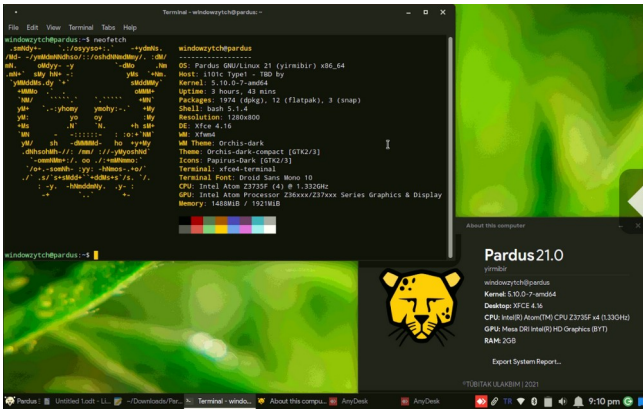

- Suggestion: ibus-mozc package can be preinstalled for Japanese input.
Result: The ability to type in Japanese without installing additional packages can be provided for people learning Japanese like me.

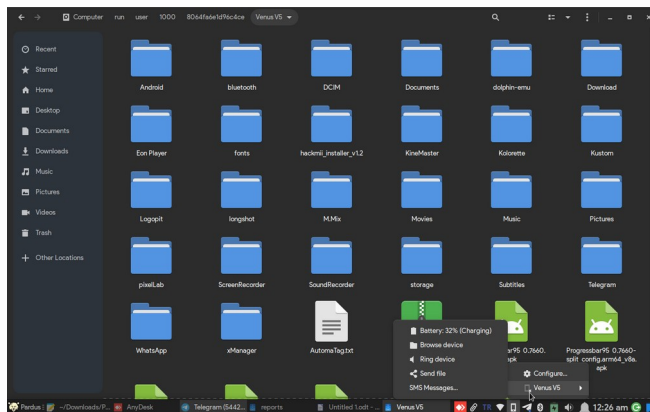

- Issue: Brightness doesn't work on Intel Atom BayTrail GPU.
Result: When using in dark, eye strain may cause even if dark mode is set.
- Issue: Power Manager Plugin's and Notification Plugin's icons look so big on some icon themes (For example Papirus).
Result: Icons on panel look inconsistent.

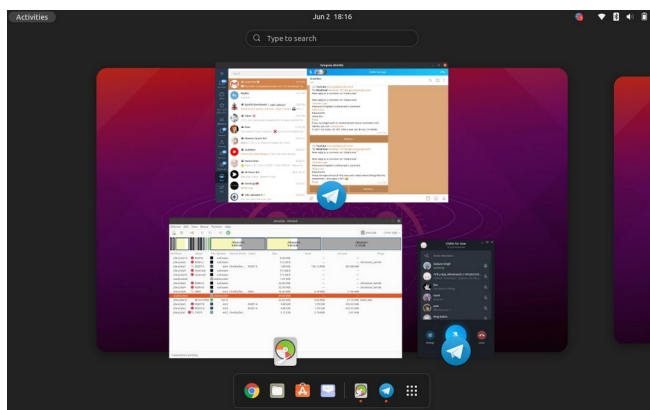

- Issue: Snap support is broken: Snap paths aren't added to PATH and .desktop shortcuts don't get created.
Result: Apps installed over Snap (For example Discord) can't be run without using "snap run <app>" command from terminal.

- Suggestion: Orchis can be used instead of Adwaita.
Result: System looks more modern.

- Suggestion: A companion app for KDE Connect (For example <https://github.com/b4j4/indicator-kdeconnect>) or a replacement could be made.
Result: Someone switching from KDE desktop (For example Kubuntu or KDE neon) could continue to use full integration using KDE Connect app on their phone.

- Suggestion: It would be better if GNOME 40 was used as GNOME version in repos.
Result: A newer and faster GNOME desktop environment would be provided.

- Issue: Several Deepin apps work problematic on other desktop environments like XFCE, GNOME, KDE. (Theme doesn't load, system logs get spammed, etc.)
Solution suggestion: DDE can be added back from UbuntuDDE PPA repo (ppa:ubuntudde-dev/stable) or Deepin apps can be set to work with other desktop environments.
